Introduction

The delivery of electricity for consumption is a joint enterprise involving multiple parties and services: production, transmission, balancing, distribution and supply. Yet transactions are almost universally bilateral. This is an inefficient way to encourage participation and distorts price discovery.

Aim

Project Helios is an ambitious initiative to create a collaborative venue that will incentivise uptake in DSR and peer to peer transactions thus maximising liquidity and fairly allocating value to participants.

Expected deliverables

A provably fair smart transaction platform operating at scale and capable of providing accurate price signals for investment in distribution assets.

Required partners

Companies engaged in distribution, supply, battery installation, vehicle charging and DSR.
